

10P SHINE - BRANCHING STRATEGY FOR MERN PROJECT

Repository Setup

1. Repository Naming Convention

- A private repository should be created on github.com
- Do not forget to include README.md and .gitignore files in your repo
- Each intern's repository should include their first name and should follow the naming convention in the example below
- Example: `usama-mern-10pshine`

2. Folder Structure

- Each repository should maintain the following folder structure:
 - i. `/backend`
 - ii. `/frontend`

Branching Strategy

3. Main Branches

- There would be two main branches which are as follows:
- `main`
 - i. This will have Production-ready code.
- `develop`
 - i. This will have the latest development changes and integration branch.

4. Feature Branches

- For new features, create branches with a prefix indicating whether the feature is for the frontend or backend.
- Naming convention:
 - **Frontend:** `feature/frontend/<feature-name>`
 - **Backend:** `feature/backend/<feature-name>`
- Examples:

- Frontend: `feature/frontend/user-page`
- Backend: `feature/backend/user-api`

5. Bugfix Branches

- For bug fixes, similarly, create branches with a prefix for frontend or backend.
- Naming convention:
 - **Frontend:** `bugfix/frontend/<bug-description>`
 - **Backend:** `bugfix/backend/<bug-description>`
- Examples:
 - **Frontend:** `bugfix/frontend/fix-css-error`
 - **Backend:** `bugfix/backend/fix-database-connection`

Workflow

6. Creating a Feature Branch

```
# For frontend feature
git checkout develop
git pull origin develop
git checkout -b feature/frontend/<feature-name>
```

```
# For backend feature
git checkout develop
git pull origin develop
git checkout -b feature/backend/<feature-name>
```

7. Committing Changes

- Commit frequently with clear, descriptive messages.

```
git add .
git commit -m "Add detailed description of the changes"
```

8. Pushing Changes

```
git push origin feature/frontend/<feature-name>
# or
```

```
git push origin feature/backend/<feature-name>
```

9. Creating Pull Requests (PRs)

- When a feature or bug fix is complete, create a PR from the respective **feature branch** to **develop**.
- PR should include a description of the changes and reference any relevant issue or task.
- Require at least one peer review before merging [We will discuss more about it in our next syncup].
